Front-End Developer: Example Exercise

Using the example data provided, build a simple business directory.

The directory will have three main views:
- **List View**
  - List of entries that can be filtered and sorted according to key fields
  - Only show the following fields: image, name, tagline, city, country
- **Detailed view**
  - Detailed profile with all information
  - Include Google map with location
  - Include comments at bottom
- **Map View (OPTIONAL / BONUS)**
  - Show all entries on a Google Map
  - This can possibly be on the same page as the list view

Additional Requirements

- Design is not important for this exercise, but general layout is (Dont get stuck on details though, general functionality is much more important).
- Directory should be mobile friendly.
- You are building a Single Page Application.
- Use Vue2 with Webpack. Make use of single file vue components
- It is suggested that you make use of vue-router. (Example: example-directory.com/[listing-id] should take you to the detailed view for that record)
- Although you will be accessing the example data directly from a file, implement the access (methods) in such a way that it would be easy to replace with network calls at a later stage.
